Applications of forward-time simulations

Features of simuPOP

Dive into simuPOP

More examples

Bundled Scripts

- Start from a sample with unknown genotypes
- Coalesce individuals until the most recent common ancestor of all individuals is found
- Starting from the MRCA, proceed forward in time and fill the genotype of each individual

Forward vs. backward-time simulations

simuPOP tutorial

Bo Peng,
Ph.D.

What is simuPOP

Forward- and
backward-time
simulation

Applications of
forward-time
simulations

Features of
simuPOP
Availability

Dive into simuPOP

More examples

Bundled Scripts

Backward-time

- Sample based,
efficient

Forward-time

- Population based,
inefficient

Forward vs. backward-time simulations

simuPOP tutorial

Bo Peng,
Ph.D.

What is simuPOP

Forward- and
backward-time
simulation

Applications of
forward-time
simulations

Features of
simuPOP
Availability

Dive into simuPOP

More examples

Bundled Scripts

Backward-time

- Sample based, efficient
- Limited selection, recombination models and mating schemes

Forward-time

- Population based, inefficient
- Can simulate almost arbitrary evolutionary scenarios

Forward vs. backward-time simulations

simuPOP tutorial

Bo Peng,
Ph.D.

What is simuPOP

Forward- and
backward-time
simulation

Applications of
forward-time
simulations

Features of
simuPOP
Availability

Dive into simuPOP

More examples

Bundled Scripts

Backward-time

- Sample based, efficient
- Limited selection, recombination models and mating schemes
- Can not study population properties, or properties of ancestral generations

Forward-time

- Population based, inefficient
- Can simulate almost arbitrary evolutionary scenarios
- Can study population properties and ancestral generations

Forward vs. backward-time simulations

simuPOP tutorial

Bo Peng,
Ph.D.

What is simuPOP

Forward- and
backward-time
simulation

Applications of
forward-time
simulations

Features of
simuPOP
Availability

Dive into simuPOP

More examples

Bundled Scripts

Backward-time

- Sample based, efficient
- Limited selection, recombination models and mating schemes
- Can not study population properties, or properties of ancestral generations
- Used mostly for sample generation

Forward-time

- Population based, inefficient
- Can simulate almost arbitrary evolutionary scenarios
- Can study population properties and ancestral generations
- Not limited to sample generation

Applications of forward-time simulations

simuPOP tutorial

Bo Peng,
Ph.D.

What is simuPOP

Forward- and
backward-time
simulation

Applications of
forward-time
simulations

Features of
simuPOP
Availability

Dive into simuPOP

More examples

Bundled Scripts

simuPOP can simulate the change of the genetic composition of a population in a complicated evolutionary process. It can be used to

- Demonstrate population genetics phenomena

Applications of forward-time simulations

simuPOP tutorial

Bo Peng,
Ph.D.

What is simuPOP

scripting simuPOP is provided as a set of Python modules, and is therefore backed by a full-blown object-oriented programming language.

flexibility simuPOP does not impose any limit on the size of genome, population, demographic model, etc. Using a large number of standard and hybrid (Python-assisted) operators, users can simulate almost arbitrarily complex evolutionary processes.

integration Owing to the 'glue language' nature of Python, it is easy to integrate simuPOP with other languages and programs.

I like it, but, oohm, why Python??

Bundled Scripts

- The core of simuPOP is written in C++ for efficiency
- Python is the glue language, a wrapper of the core
- Python is used to write simuPOP extensions (user interface etc)
- Python is used to provide user-defined behaviors during evolution (Python operators)

Do I have to write a script?

simuPOP can be used in two ways:

- You should learn how to write simuPOP scripts if you
 - need a particular type of simulation for you own research, and
 - know exactly what you want to do
- You can use existing simuPOP scripts without knowing simuPOP if
 - you need to use an existing simulation scenario to simulate samples or populations
 - this scenario is implemented in simuPOP

Calculate effective number of alleles

The effective number of alleles can be estimated from a population by

$$\hat{n}_e = \left(\sum_{i>0} \left(\frac{f_i}{f_0} \right)^2 \right)^{-1} = \frac{f_0^2}{\sum_{i>0} f_i^2}$$

where f_i is the frequency of allele i , and $f_0 = \sum_{i>0} f_i$ is the total disease allele frequency (assuming 0 is the only wildtype allele).

```
>>> def Ne(pop, loci):
...     'Calculate effective number of alleles'
...     Stat(pop, alleleFreq=loci)
...     pop.dvars().Ne = {}
...     v = pop.dvars().alleleFreq
...     for locus in loci:
