**scripting** simuPOP is provided as a set of Python modules, and is therefore backed by a full-blown object-oriented programming language.

**flexibility** simuPOP does not impose any limit on the size of genome, population, demographic model, etc. Using a large number of standard and hybrid (Python-assisted) operators, users can simulate almost arbitrarily complex evolutionary processes.

**integration** Owing to the 'glue language' nature of Python, it is easy to integrate simuPOP with other languages and programs.

# I like it, but, oohm, why Python??

**simuUtil.py** provides functions to save/load in many formats, gene mapping functions, list variables etc

**simuCluster.py** a control script to send jobs to cluster systems

**simuLDDecay.py** a simple script to demonstrate the decay of linkage disequilibrium under recombination

**simuForward.py** implements a traditional forward-time simulation scenario

**simuComplexDisease.py** implements a new forward-time simulation method (PLoS Genetics, 2007)

**simuCDCV.py** demonstrate the evolution of allelic spectrum
